LOD as a new way of producing, sharing and reusing information

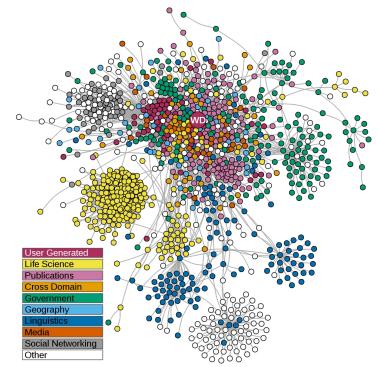

The goal of Linked Open Data is:

- Connect data across projects and domains, thus breaking information silos
- Allow an easy exchange and reuse of the information

In other words: make data FAIR.

This would change how scholars can produce knowledge.

The challenges of interoperability

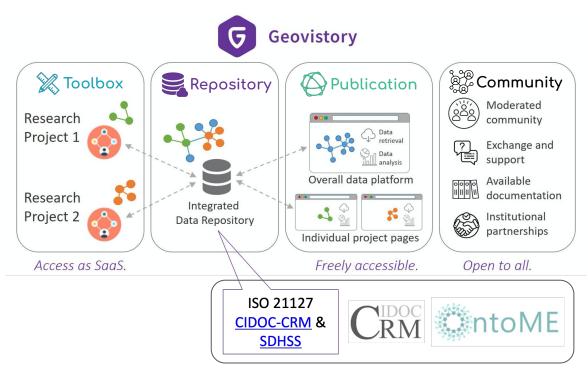

Achieving interoperability hinges on two critical components:

- Unambiguous identification of real-world entities (e.g., persons, places, concepts)
 - With unique identifiers (URI)
 - With links between identical entities across different projects
- The utilization of explicit ontologies that can be aligned across projects.
 - However, mapping between ontologies may prove challenging, or even unfeasible, particularly when divergent structural frameworks are employed (e.g., an event-centric ontology may have limited compatibility with an object-centric one).

Geovistory Environment

1. The *Toolbox*

Sources

Create your library of books, manuscripts, etc. and reproduce them as texts, tables (or images)

Entities

Reconstruct reality by creating, discussing and improving your data

Digitals

Create and manage texts and tables

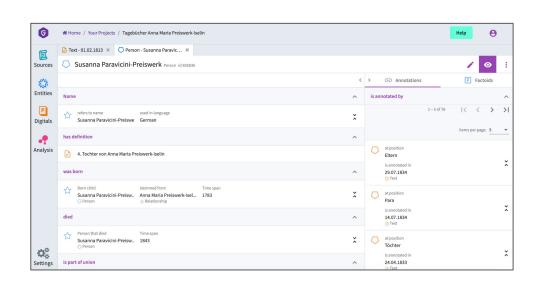

Analysis

Analyse your data, create beautiful data visualization and gain insights

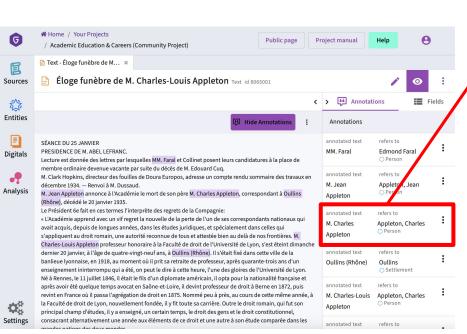

Settings

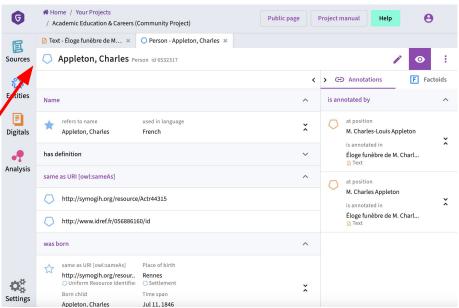

Manage controlled vocabularies & ontological settings. Activate classes and collections of classes

1. The *Toolbox*

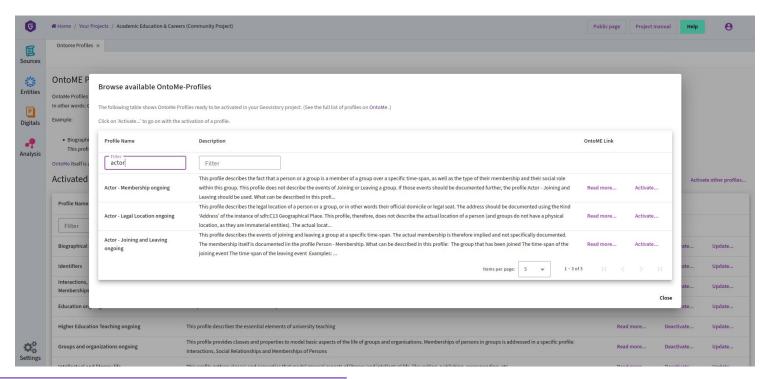

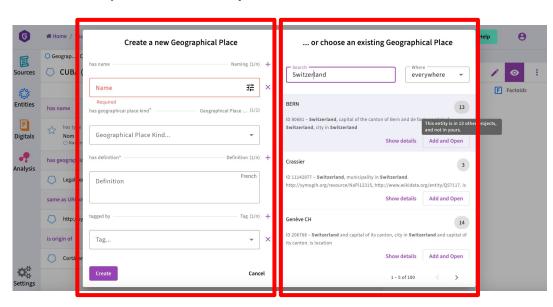

swissuniversities

1. Toolbox

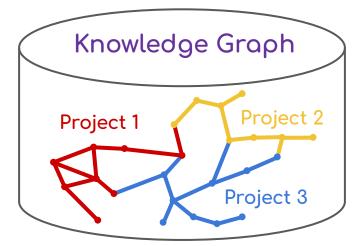

2. Repository

Specific Project

Access to the whole Knowledge Graph

3. SDHSS ontology management in Ontome

Foundational ontologies and modelling methodologies

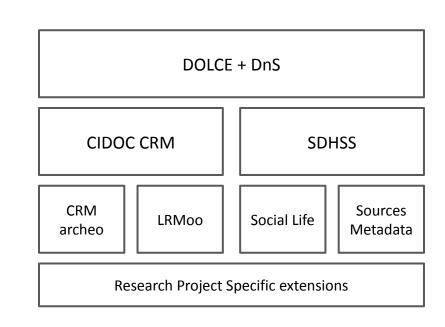

Generic, domain related core ontology

Demain related extensions

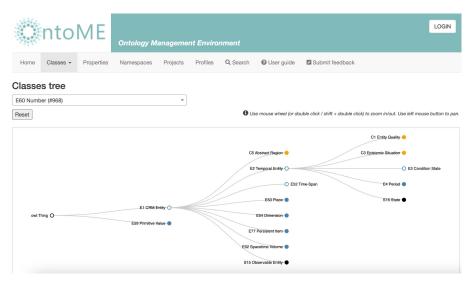

Research specific data models

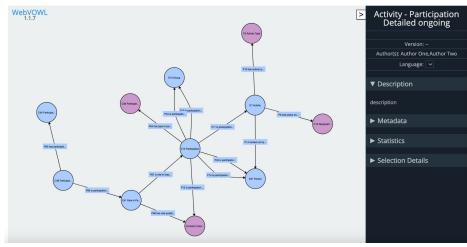

3. SDHSS ontology management in Ontome

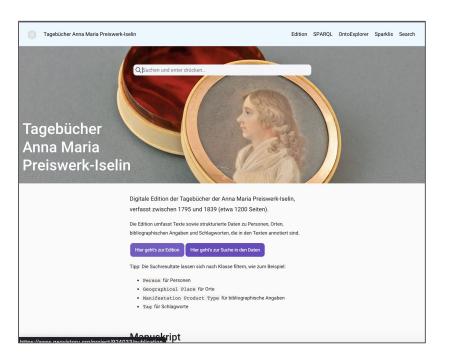

OntoME website for managing ontologies

Application profiles

swissuniversities

4. Publication

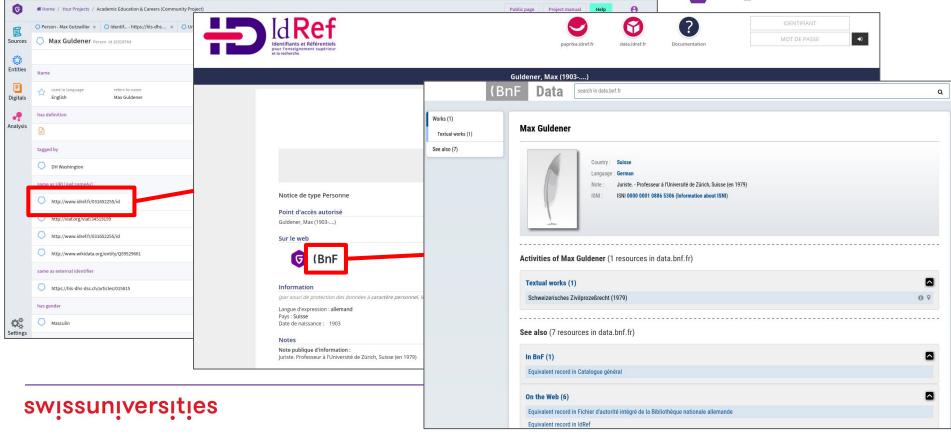

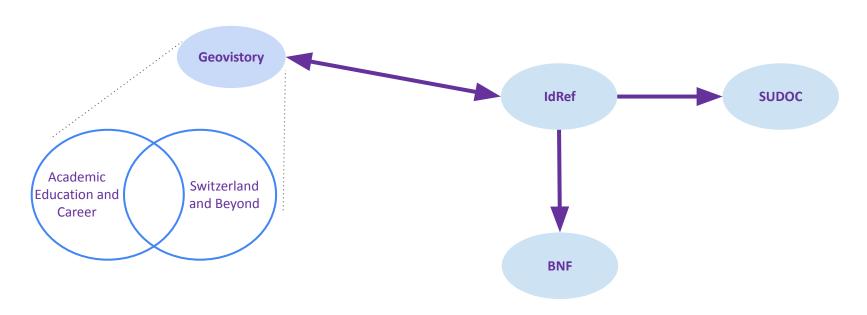

4. Geovistory in the LOD

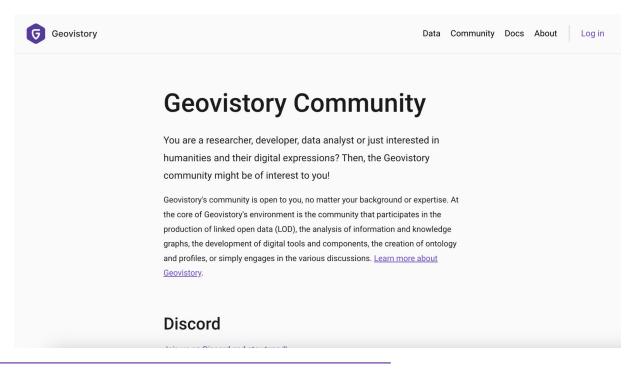

4. Geovistory in the LOD Humanities

5. Community

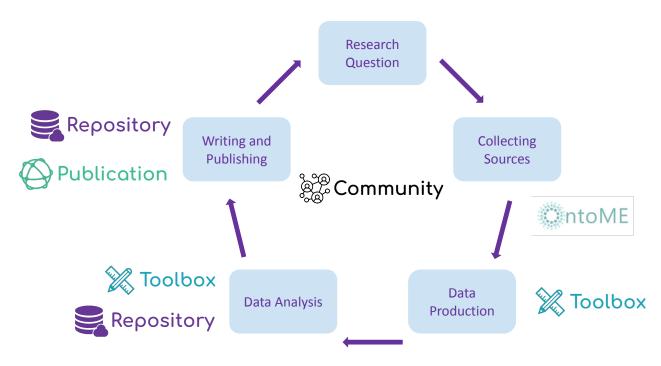

- Conferences
- Workshops
- Discord
- Newsletter

Geovistory in the research cycle
